

Petzl Safety helmets with chinstrap strength adjustment (PPE).

What happened?

The Petzl VERTEX helmet is set to the holding force 'above 50kg' instead of 'less than 25kg' to reduce the risk of strangulation in the event the helmet becomes snagged.

All locations.

What did we learn?

All employees & Contractors who are equipped with a Petzl VERTEX helmet must check the chinstrap with the adjustable holding force immediately and make sure that the holding force of the chinstrap is set to 'less than 25 kg' as per the picture EN 397: 2012.

All competent persons for Personal Fall Protection Equipment are asked to check the setting during the yearly inspection of the helmet. If the holding force of the chinstrap is not set to 'less than 25 kg' then it is to be adjusted accordingly.
